# Higher-Order Functions

#### Class outline:

- Iteration example
- Designing functions
- Generalization
- Higher-order functions
- Lambda expressions
- Conditional expressions

# Iteration example

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

0 1 1 2 3 5 8 13 21 34 ...

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

$$0 + 1 = 1$$
 2 3 5 8 13 21 34

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

$$0 \quad 1 + 1 = 2 \quad 3 \quad 5 \quad 8 \quad 13 \quad 21 \quad 34 \dots$$

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

$$0 \quad 1 \quad 1 + 2 = 3 \quad 5 \quad 8 \quad 13 \quad 21 \quad 34 \dots$$

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

$$0 \quad 1 \quad 1 \quad 2 + 3 = 5 \quad 8 \quad 13 \quad 21 \quad 34 \dots$$

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

 $0 \quad 1 \quad 1 \quad 2 \quad 3 + 5 = 8 \quad 13 \quad 21 \quad 34 \dots$ 

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

 $0 \quad 1 \quad 1 \quad 2 \quad 3 \quad 5 + 8 = 13 \quad 21 \quad 34 \dots$ 

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

 $0 \quad 1 \quad 1 \quad 2 \quad 3 \quad 5 \quad 8 + 13 = 21 \quad 34 \dots$ 

Discovered by Virahanka in India, 600-800 AD, later rediscovered in Western mathematics and commonly known as Fibonacci numbers.

 $0 \quad 1 \quad 1 \quad 2 \quad 3 \quad 5 \quad 8 \quad 13 + 21 = 34 \dots$ 

# Virahanka's question

How many poetic meters exist for a total duration?

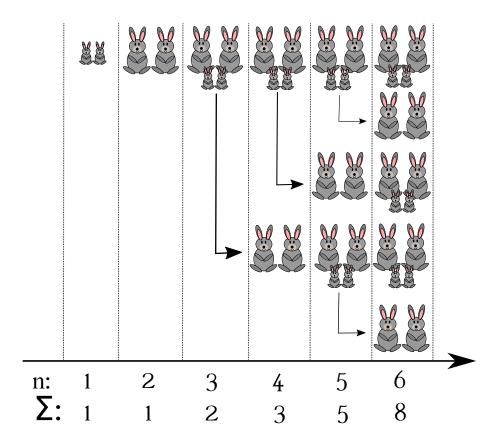

S =short syllable, L =long syllable

<b>Duration</b>	Meters	Total
1	S	1
2	SS, L	2
3	SSS, SL, LS	3
4	SSSS, SSL, SLS, LSS, LL	5
5	SSSSS, SSSL, SSLS, SLSS, SLL, LLS, LSL, LSSS	8

The So-called Fibonacci Numbers in Ancient and Medieval India

# Fibonacci's question

How many pairs of rabbits can be bred after N months?

Attribution: Fschwarzentruber, Wikipedia

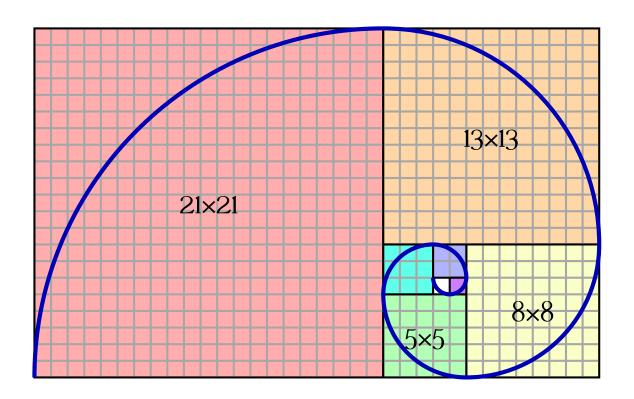

# Virahanka-Fibonacci number generation

```
VF 0 1 1 2 3 5 8 13 21 34 55 ...
N 0 1 2 3 4 5 6 7 8 9 10 ...
```

```
def vf_number(n):
    """Compute the nth Virahanka-Fibonacci number, for N >= 1.
    >>> vf_number(2)
    1
    >>> vf_number(6)
    8
    """
    prev = 0  # First Fibonacci number
    curr = 1  # Second Fibonacci number
    k = 1
    while k < n:
        (prev, curr) = (curr, prev + curr)
        k += 1
    return curr</pre>
```

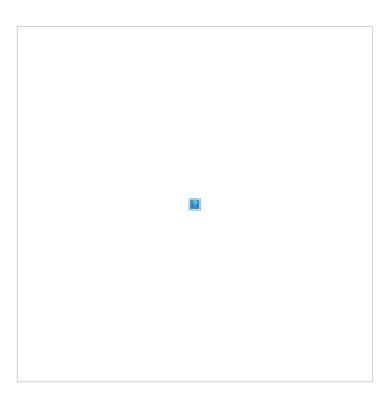

# Golden spiral

The Golden spiral can be approximated by Virahanka-Fibonacci numbers.

#### Go bears!

The Golden spiral is found everywhere in nature...

# **Designing Functions**

# **Describing Functions**

```
def square(x):
    """Returns the square of X."""
    return x * x
```

Aspect	Example
A function's <b>domain</b> is the set of all inputs it might possibly take as arguments.	x is a number
A function's <b>range</b> is the set of output values it might possibly return.	square returns a non-negative real number
A pure function's <b>behavior</b> is the relationship it creates between input and output.	square returns the square of x

# Designing a function

Give each function exactly one job, but make it apply to many related situations.

```
round(1.23) # 1
round(1.23, 0) # 1
round(1.23, 1) # 1.2
round(1.23, 5) # 1.23
```

**Don't Repeat Yourself (DRY)**: Implement a process just once, execute it many times.

# Generalization

# Generalizing patterns with arguments

Geometric shapes have similar area formulas.

Shape	?	?	?
Area	$1 * r^2$	$\pi * r^2$	$\left rac{3\sqrt{3}}{2} ight *r^{2}$

# A non-generalized approach

```
from math import pi, sqrt
def area square(r):
    return r * r
def area circle(r):
    return r * r * pi
def area_hexagon(r):
    return r * r * (3 * sqrt(3) / 2)
```

How can we generalize the common structure?

#### Generalized area function

```
from math import pi, sqrt

def area(r, shape_constant):
    """Return the area of a shape from length measurement R."""
    if r < 0:
        return 0
    return r * r * shape_constant

def area_square(r):
    return area(r, 1)

def area_circle(r):
    return area(r, pi)

def area_hexagon(r):
    return area(r, 3 * sqrt(3) / 2)</pre>
```

# Higher-order functions

#### What are higher-order functions?

A function that either:

- Takes another function as an argument
- Returns a function as its result

All other functions are considered first-order functions.

#### Generalizing over computational processes

$$\sum_{k=1}^{5} \boxed{k} = 1 + 2 + 3 + 4 + 5 = 15$$

$$\sum_{k=1}^{5} k^3 = 1^3 + 2^3 + 3^3 + 4^3 + 5^3 = 225$$

$$\sum_{k=1}^{5} rac{8}{(4k-3)\cdot (4k-1)} = rac{8}{3} + rac{8}{35} + rac{8}{99} + rac{8}{195} + rac{8}{323}$$

The common structure among functions may be a computational process, not just a number.

#### Functions as arguments

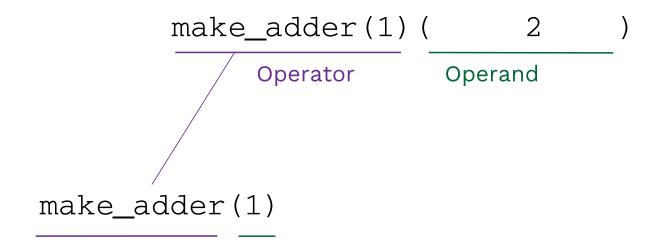

```
def cube(k):
    return k ** 3
def summation(n, term):
    """Sum the first N terms of a sequence.
    >>> summation(5, cube)
    225
    0.00
    total = 0
    k = 1
    while k <= n:</pre>
       total = total + term(k)
       k = k + 1
    return total
```

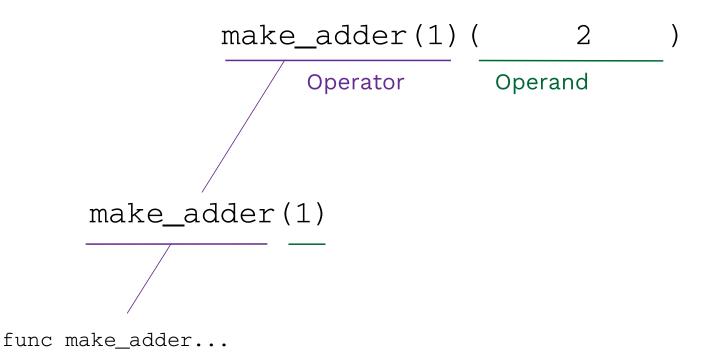

# Functions as return values

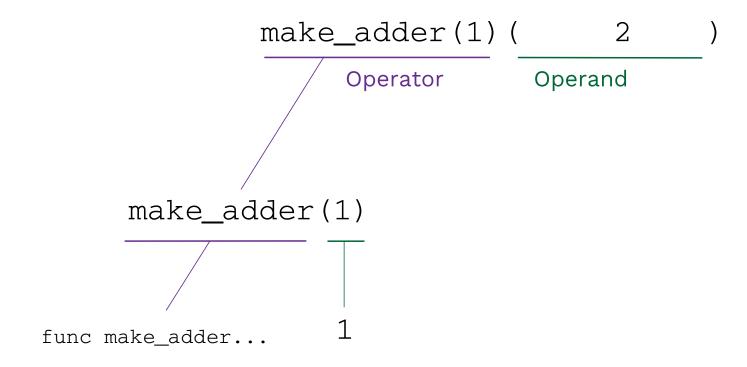

# Locally defined functions

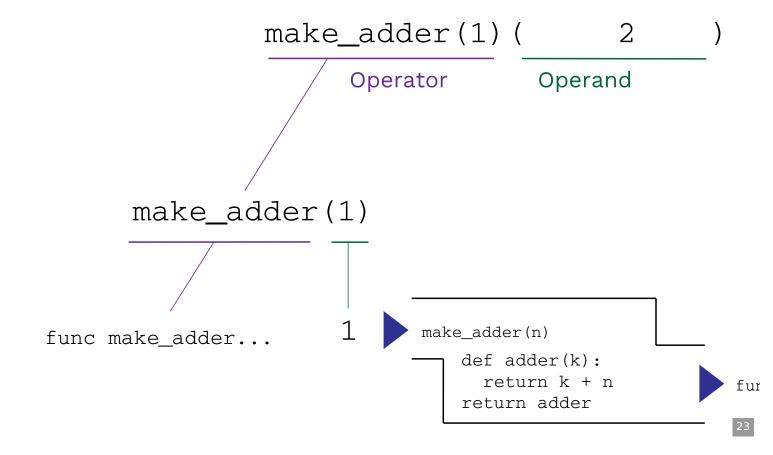

Functions defined within other function bodies are bound to names in a local frame.

```
def make_adder(n):
    """Return a function that takes one argument k
        and returns k + n.
    >>> add_three = make_adder(3)
    >>> add_three(4)
    7
    """
    def adder(k):
        return k + n
    return adder
```

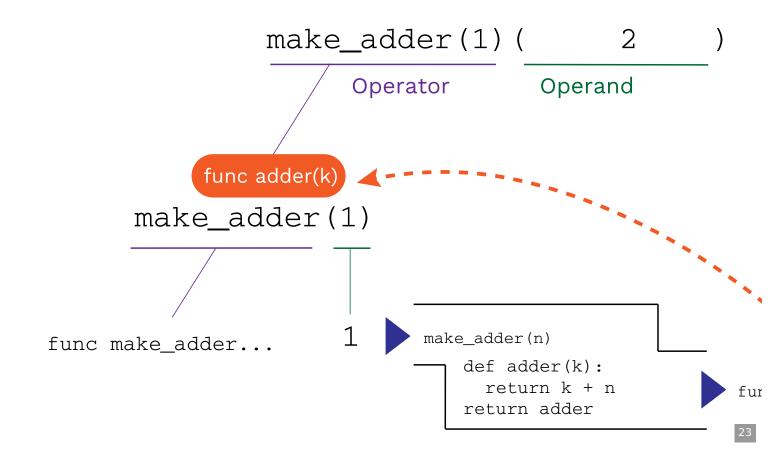

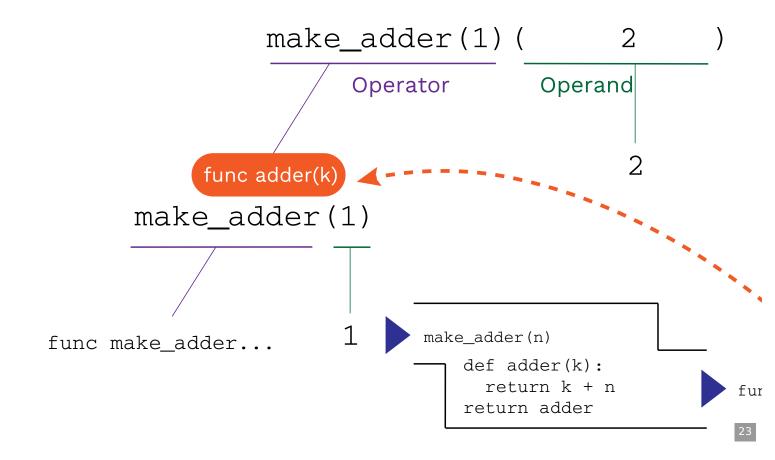

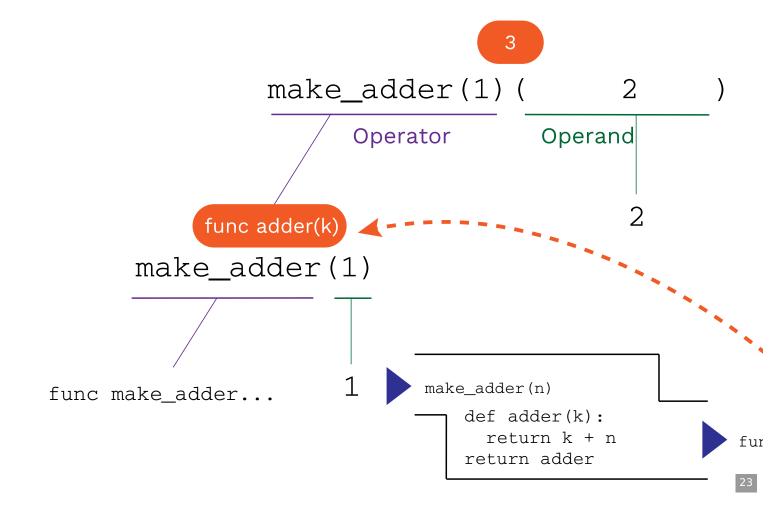

### Call expressions as operator expressions

### Call expressions as operator expressions

### Call expressions as operator expressions

# Lambda expressions

## Lambda syntax

A **lambda expression** is a simple function definition that evaluates to a function.

The syntax:

```
lambda <parameters>: <expression>
```

A function that takes in parameters and returns the result of expression.

### Lambda syntax

A **lambda expression** is a simple function definition that evaluates to a function.

The syntax:

```
lambda <parameters>: <expression>
```

A function that takes in parameters and returns the result of expression.

A lambda version of the square function:

```
square = lambda x: x * x
```

A function that takes in parameter x and returns the result of x \* x.

### Lambda syntax tips

A lambda expression does **not** contain return statements or any statements at all.

#### Incorrect:

```
square = lambda x: return x * x
```

#### Correct:

```
square = lambda x: x * x
```

### Def statements vs. Lambda expressions

```
def square(x):
    return x * x
square = lambda x: x * x
```

Both create a function with the same domain, range, and behavior.

Both bind that function to the name square.

Only the def statement gives the function an **intrinsic name**, which shows up in environment diagrams but doesn't affect execution (unless the function is printed).

## Lambda as argument

It's convenient to use a lambda expression when you are passing in a simple function as an argument to another function.

Instead of...

```
def cube(k):
    return k ** 3

summation(5, cube)
```

We can use a lambda:

```
summation(5, lambda k: k ** 3)
```

# Conditional expressions

### Conditional expressions

A conditional expression has the form:

```
<consequent> if <predicate> else <alternative>
```

#### **Evaluation rule:**

- Evaluate the predicate
   expression.
- If it's a true value, the value of the whole expression is the value of the <consequent>.
- Otherwise, the value of the whole expression is the value of the <alternative>.

### Lambdas with conditionals

This is invalid syntax:

```
lambda x: if x > 0: x else: 0
```

Conditional expressions to the rescue!

```
lambda x: x if x > 0 else 0
```
