

Web Apps

Class outline:

- How the web works
- Server-side Python
- CS61A projects

How the web works

Clients and servers

HTTP

A client sends an HTTP request:

```
GET /index.html HTTP/1.1  
Host: www.example.com
```

The server sends back an HTTP response:

```
HTTP/1.1 200 OK  
Content-Type: text/html; charset=UTF-8  
Content-Length: 208  
<!DOCTYPE html>  
  <html>  
    <head>  
      <title>Example Domain</title>  
    </head>  
    <body>  
      <h1>Example Domain</h1>  
      <p>This domain is to be used for illustrative examples in documents.</p>  
    </body>  
</html>
```

Webpages

Webpages are made up of three languages:

- **HTML:** Contains the content and uses tags to break it into semantic chunks (headings, paragraphs, etc)
- **CSS:** Contains style rules that apply properties to elements on a page.
- **JavaScript:** Contains code that dynamically accesses and updates the page content to make it more interactive.

What does a server do?

The most basic server just serves up HTML and multimedia files from a file system.

Server-side code is also useful for anything that requires access to persistent data or needs an additional layer of security than allowed in the client.

- User authentication
- Database fetches/updates
- Caching

Server-side Python

Simple HTTP server

From the standard library, the `http module` can run a basic server. But it is **not** recommended for production.

Running a simple file server:

```
python -m http.server 8000
```

Demo: Simple dynamic pages

Using the http module to dynamically generate responses.

simpleserverexample.pamelafox2.repl.co/path

View the code by clicking the "Code" tab at

<https://replit.com/@PamelaFox2/SimpleServerExample>

Based on [this code](#).

Flask framework

An external package, [Flask](#) is a lightweight framework for server requests and responses.

Apps written in Flask:

- [cs61a.org](#)
- Khan Academy (originally)
- Reddit
- Netflix

Demo: Simple Flask website

Using the Flask framework to generate responses for each routes.

simpleflaskexample.pamelafox2.repl.co/

View the code by clicking the "Code" tab at <https://replit.com/@PamelaFox2/SimpleFlaskExample>

Based on [this tutorial](#).

Webapps with Databases

Web apps store any data in databases that needs to be shared across multiple users/computers.

Demo App: Native or Not?

flaskdbexample-orm.pamelafox2.repl.co/

View the code by clicking the "Code" tab at

<https://replit.com/@PamelaFox2/FlaskDBExample-ORM>

Demo App: 61A Merch

61amerch-orm.pamelafox2.repl.co/

View the code by clicking the "Code" tab at
<https://replit.com/@PamelaFox2/61aMerch-ORM>

Django framework

An external library, Django is a fairly heavyweight/opinionated framework for server-side code. Includes an ORM for database interaction.

Apps written in Django:

- Coursera (originally, now Scala+Play)
- Instagram
- Pinterest (originally, now Flask)
- Eventbrite

CS61A projects

Common files

Hog and Cats both use the http module to run a server and share common files for setting up the server.

`common_server.py`

Cats code

The Cats code includes many routes for handling multiplayer games, since those require access to the database.

[multiplayer.py](#)

Hog code

The Hog code includes routes for taking the next turn. It does not store anything in a database, the browser just remembers all the turns.

`hog_gui.py`
